Week 5:

1. Multi-Role Scoped Token Authentication & Routing (src/services/api.js, App.jsx):

- Implemented intelligent route-based token selection and role-scoped session storage (sos_token_patient, sos_token_staff, sos_token_admin) to eliminate session collisions when switching roles during development.

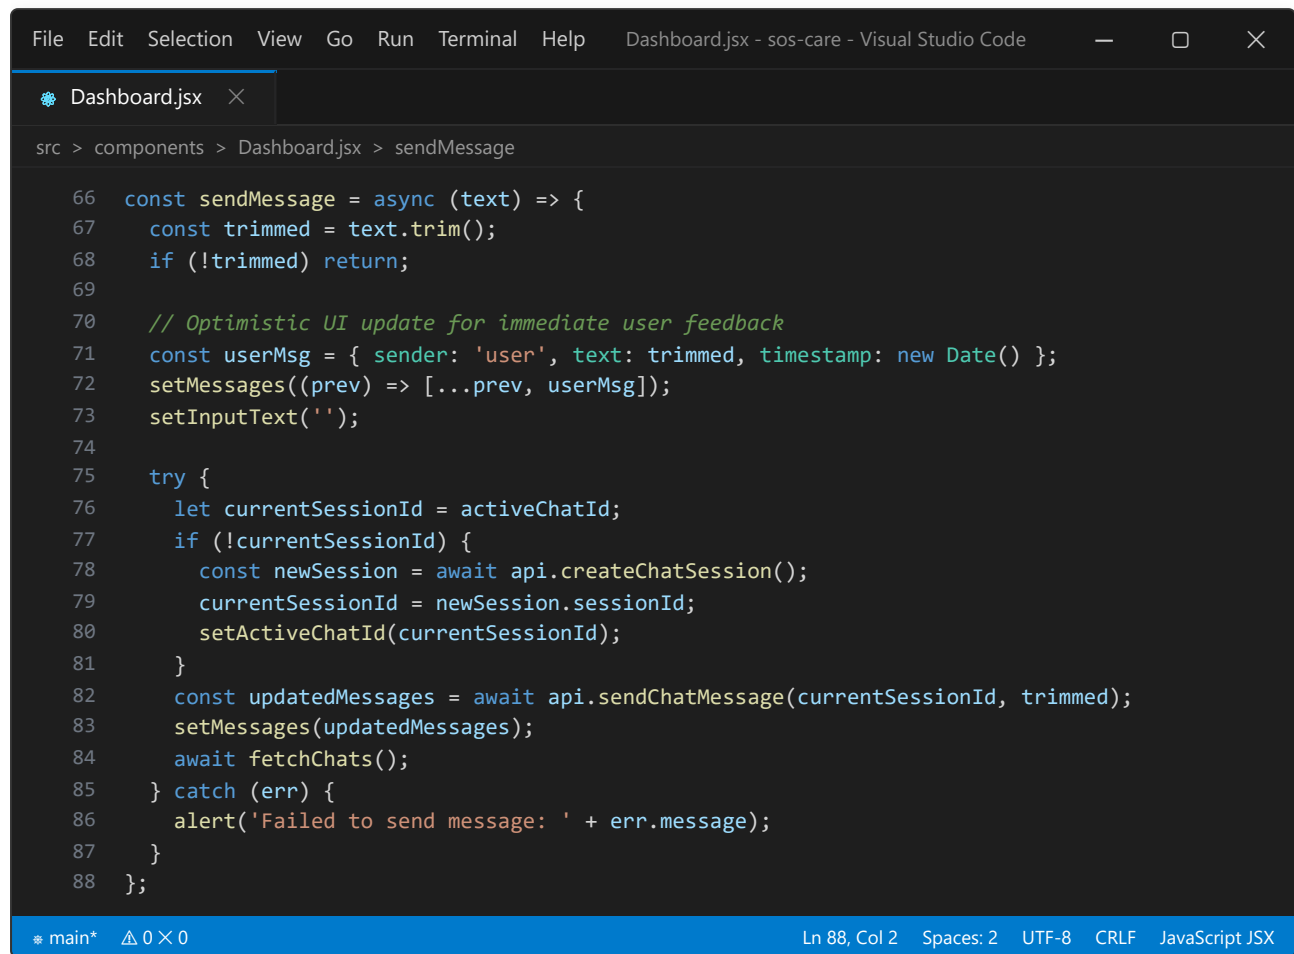

```
File Edit Selection View Go Run Terminal Help  api.js - sos-care - Visual Studio Code
JS api.js x
src > services > api.js > getHeaders

3  const getHeaders = () => {
4    let token = sessionStorage.getItem('sos_token'); // Fallback Legacy
5
6    // Intelligent token selection based on route
7    const path = window.location.pathname;
8    if (path.startsWith('/ikh/admin')) {
9      token = sessionStorage.getItem('sos_token_admin') || token;
10   } else if (path.startsWith('/staff')) {
11     token = sessionStorage.getItem('sos_token_staff') || token;
12   } else {
13     token = sessionStorage.getItem('sos_token_patient') || token;
14   }
15   const headers = { 'Content-Type': 'application/json' };
16   if (token) headers['Authorization'] = `Bearer ${token}`;
17   return headers;
18   };

```

2. Real-Time Patient AI Screening & Chat Synchronization (Dashboard.jsx):

- Connected the patient symptom screening chat to live MongoDB REST endpoints with optimistic UI messaging, automatic chat history synchronization, and 3-second auto-polling.

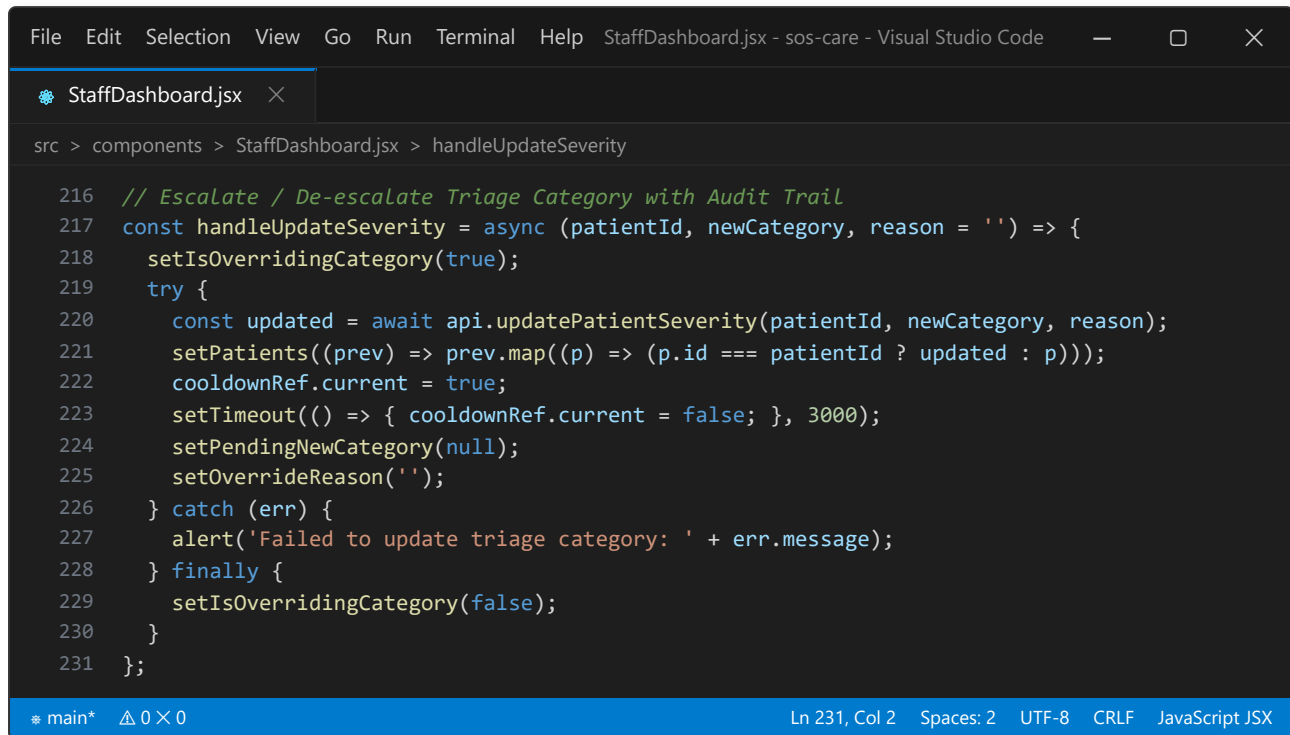

```
File Edit Selection View Go Run Terminal Help Dashboard.jsx - sos-care - Visual Studio Code
Dashboard.jsx
src > components > Dashboard.jsx > sendMessage

66 const sendMessage = async (text) => {
67   const trimmed = text.trim();
68   if (!trimmed) return;
69
70   // Optimistic UI update for immediate user feedback
71   const userMsg = { sender: 'user', text: trimmed, timestamp: new Date() };
72   setMessages((prev) => [...prev, userMsg]);
73   setInputText('');
74
75   try {
76     let currentSessionId = activeChatId;
77     if (!currentSessionId) {
78       const newSession = await api.createChatSession();
79       currentSessionId = newSession.sessionId;
80       setActiveChatId(currentSessionId);
81     }
82     const updatedMessages = await api.sendChatMessage(currentSessionId, trimmed);
83     setMessages(updatedMessages);
84     await fetchChats();
85   } catch (err) {
86     alert('Failed to send message: ' + err.message);
87   }
88 };
```

* main* 0x0 Ln 88, Col 2 Spaces: 2 UTF-8 CRLF JavaScript JSX

3. Interactive Clinical Severity Override & Rationale Notes (StaffDashboard.jsx):

- Developed clinical decision controls allowing attending doctors to reclassify triage priority (Escalate to Red Alert, De-escalate to Green Routine) with mandatory clinical rationale notes.

```
File Edit Selection View Go Run Terminal Help StaffDashboard.jsx - sos-care - Visual Studio Code

StaffDashboard.jsx X

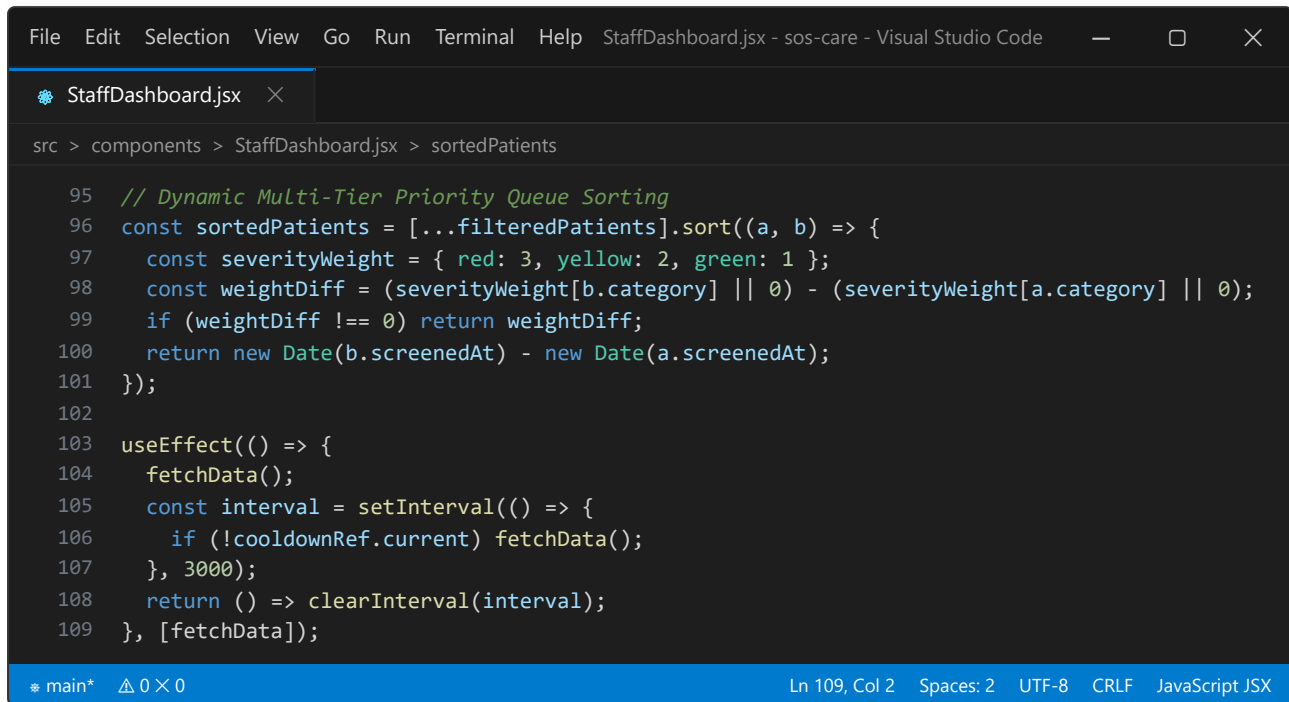

src > components > StaffDashboard.jsx > handleUpdateSeverity

216 // Escalate / De-escalate Triage Category with Audit Trail
217 const handleUpdateSeverity = async (patientId, newCategory, reason = '') => {
218   setIsOverridingCategory(true);
219   try {
220     const updated = await api.updatePatientSeverity(patientId, newCategory, reason);
221     setPatients((prev) => prev.map((p) => (p.id === patientId ? updated : p)));
222     cooldownRef.current = true;
223     setTimeout(() => { cooldownRef.current = false; }, 3000);
224     setPendingNewCategory(null);
225     setOverrideReason('');
226   } catch (err) {
227     alert('Failed to update triage category: ' + err.message);
228   } finally {
229     setIsOverridingCategory(false);
230   }
231 };
```

* main* 0 X 0 Ln 231, Col 2 Spaces: 2 UTF-8 CRLF JavaScript JSX

4. Clinical Triage Queue Priority Sorting & Auto-Polling (StaffDashboard.jsx):

- Engineered dynamic multi-tier priority queue sorting (Red Alert > Yellow Priority > Green Routine) combined with 3-second auto-polling to synchronize screening submissions in real-time.

```
File Edit Selection View Go Run Terminal Help StaffDashboard.jsx - sos-care - Visual Studio Code
StaffDashboard.jsx
src > components > StaffDashboard.jsx > sortedPatients

 95 // Dynamic Multi-Tier Priority Queue Sorting
 96 const sortedPatients = [...filteredPatients].sort((a, b) => {
 97   const severityWeight = { red: 3, yellow: 2, green: 1 };
 98   const weightDiff = (severityWeight[b.category] || 0) - (severityWeight[a.category] || 0);
 99   if (weightDiff !== 0) return weightDiff;
100   return new Date(b.screenedAt) - new Date(a.screenedAt);
101 });
102
103 useEffect(() => {
104   fetchData();
105   const interval = setInterval(() => {
106     if (!cooldownRef.current) fetchData();
107   }, 3000);
108   return () => clearInterval(interval);
109 }, [fetchData]);
